

AMENDMENTS TO THE SPECIFICATION

IN THE ABSTRACT

Please replace the Abstract with the following amended Abstract:

The invention relates to a method of indicating about an incoming connection and a radio terminal equipment arrangement (90) comprising: a cellular core unit (100) comprising: a control unit (114); and one or more peripheral units (102,104). The control unit (114) is configured to indicate the incoming connection in one or more peripheral units (102,104) but not in the cellular core unit (100), when the LPRF connection between the cellular core unit (100) and the peripheral unit (102,104) is available; and to indicate the incoming connection in the cellular core unit (100), when the LPRF connection between the cellular core unit (100) and the peripheral unit (102,104) is not available and to indicate the incoming connection in the peripheral unit (102,104), when the LPRF connection between the cellular core unit (100) and the peripheral unit (102,104) becomes available.
